## 41 critical microsoft-windows-kernel-power system server 2008

---

### I am getting Kernel Power 41 Critical Error on Windows 11 after

Kernel Power 41 Critical errors are usually caused by a power problem, possibly the PSU on your PC. Please check to see if your PC is producing any minidump files, I will check those to see if they provide any insight into a potential cause of the system crashes. Open Windows File Explorer. Navigate to C:WindowsMinidump

### [Kernel Power Critical Error, event id 41](#)

4. The power cable between the mains power socket and the computer becomes disconnected at either end. 5. A power surge or lightning strike occurs. Your computer should connect to an uninterruptible power supply unit, which then connects to the mains supply. If an incident occurs you will have to reset the uninterruptible power supply unit.

### Windows Server 2012, Microsoft-Windows-Kernel-Power event 41

### [SOLVED]

what power plan are you running in settings/system/power, click on the Additional power settings link under related settings? Are you on high performance? i see lots of pc that can cope with running full speed but crash at idle, it seems odd to me. you might want to run HWINFO and log system performance to see if any sensors offer a clue.
