

Agents and multi-agent systems a short introduction for power engineers

Overview

It is the goal-directed behavior of individual agents and the ability to flexibly communicate and interact that set intelligent agents apart from other systems. Multi-agent systems A multi-agent system is simply a system comprising two or more agents or intelligent agents. Can multi-agent modeling be used in power engineering?

Multi-agent modeling for the simulation of a simple smart microgrid Applications of multiagent systems (MAS) in power engineering are of particular importance. However, little effort exists to provide an insight in MAS.

What is a multi-agent system?

“ A multi-agent system is a loosely coupled network of problem-solving entities (agents) that work together to find answers to problems that are beyond the individual capabilities or knowledge of each entity (agent)” . The fact that the agents within a MAS work together implies that a sort of cooperation among individual agents is to be involved.

What is an agent in a power system?

According to this definition an agent is any entity (physical or virtual one) that senses its environment and acting over it. Physical entities that could be considered as agents are, in the case of a power system, simple protection relay or any controller that controls directly particular power system component or part of the system.

What is a multi-agent system (MAS)?

A Multi-Agent System (MAS) is defined as a set of interacting agents in a common environment in order to solve a common, coherent task. These agents try to achieve individual objectives which are sometimes conflicting. There are three main classes of MAS: MAS in interaction with users.

How to design a multi agent system?

By developing or extending traditional software engineering approaches and knowledge engineering approaches, the design methodologies have emerged for the specification and design of multi-agent systems. Generally there are three phases for the design of a multi agent system i.e. conceptualization, analysis and design.

What is the difference between a single agent system and a multi agent system?

This explains the difference between a single agent system and a Multi Agent System. The advantage of time optimization is quite certain. The parallel processing reduces the work burden on individual agent. The modularity of MAS makes it easier for a central body to assign tasks to different agents, manage them and coordinate with them.

Towards a framework for certification of reliable autonomous systems

A computational system is called autonomous if it is able to make its own decisions, or take its own actions, without human supervision or control. The capability and spread of such systems have reached the point where they are beginning to touch much of everyday life. However, regulators grapple with how to deal with autonomous systems, for ...

A normative approach for resilient multiagent systems

We model a multiagent system (MAS) in socio-technical terms, combining a social layer consisting of norms with a technical layer consisting of actions that the agents execute. This approach emphasizes autonomy, and makes assumptions about both the social and technical layers explicit. Autonomy means that agents may violate norms. In our approach, ...
