## Overview

Can I install solar panels if I don't meet building regulations?

Your local authority can also apply for a Confiscation Order to take away any money you've earned with your system – so there's absolutely no benefit to installing solar panels that don't meet building regulations. It's crucial that your solar installation follows all building regulations.

Do you need a solar panel diagram?

Diagrams are the best way to plan out the configuration of your solar panel array and balance of system before you start generating potentially hazardous high-voltage electricity. That way, you can make sure it works on paper first.

How many solar panels do I Need?

You have to install a minimum of 20 250-watt panels for your home to become completely energy independent. If you're using more than one solar panel, you need to find out how to connect multiple solar panels. By using solar panels, you can reduce the amount of power that your power grid uses.

Can solar PV systems be installed on a pitched roof?

The guidelines also say that provision must be made for ventilation behind the solar PV modules to provide cooling. With the introduction of MCS012 in March 2012 we would now expect all MCS certified installers of solar PV systems to install solar PV systems on pitched roofs using only MCS012 certified roof fixings.

How to install a solar PV system?

Step 1: Prepare the mounts that will provide solid support to your panels. You can choose flush mounts or roof-ground mounts, whatever you think is best for you. A good rule of thumb is if you reside in the Northern Hemisphere, your solar PV systems must face the South, East, or West.

## Do solar panels need wiring?

Most modern photovoltaic systems for residential or portable use don't actually require much "wiring." At least not in the traditional sense of soldering circuits together. The majority of solar panels and balance of system components use standardized connectors and cables, such as the Universal Solar Connector.
