## Overview

---

These hybrid rotary UPS designs do not have official designations, although one name used by UTL is "double conversion on demand". This style of UPS is targeted towards high-efficiency applications while still maintaining the features and protection level offered by double conversion. A hybrid (double conversion on demand) UPS operates as an off-line/standby UPS when power conditions are within a certain preset window. This allows the UPS to achieve very high efficiency.

What is a backup power supply?

**High-Efficiency Backup Power Supply** A backup power supply is an electrical system that provides emergency power to a load when the main power source fails. An appropriate backup power supply provides instantaneous protection from main power interruptions without glitches, by supplying energy which is stored in backup capacitors or batteries.

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply or uninterruptible power source (UPS) is an electrical apparatus that provides backup or emergency power to a load when the normal input power source is purposely removed or fails. There are three common UPS topologies that will be considered in this risk analysis: standby, line interactive, and double conversion.

Does a backup power supply comply with BS 50171?

This is why a method of backup power supply, such as a UPS system, must be present to comply with BS EN 50171. Where an uninterruptible power supply system is used, it must also comply with product-specific regulations highlighted in EN 62040 and its relevant parts.

Do you need an emergency power ups system for a life safety application?

A UPS solution for a life safety application is therefore different to those found in a data centre infrastructure application, for example. The inverter, battery back-up time and regenerative lift require an emergency power UPS system but if the power is routed through a standard uninterruptible power supply, it

will falter and damage it.

Does a fire suppression system need a backup power supply?

Fire suppression systems are interlinked with a central emergency power system to automatically activate in the event of a fire. This is why a method of backup power supply, such as a UPS system, must be present to comply with BS EN 50171.

How do I protect my power supply from a power supply failure?

Redundant protection can be extended further yet by connecting each power supply to its own UPS. This provides double protection from both a power supply failure and a UPS failure, so that continued operation is assured. This configuration is also referred to as 1 + 1 or 2N redundancy.

### Backup Generator Vs. Uninterruptible Power Supply (UPS)

UPS systems are powered by batteries, and most also have a connection to the utility grid. UPS systems provide shorter backup times than

generators. Generators take a bit to start up, but an uninterruptible power supply (UPS) does so practically instantly. In

### Emergency vs. Standby Systems: What is the Difference?

The term "Emergency Generator" is often used incorrectly to describe the generator used to provide backup power to a facility. Officially, as defined by NFPA 70, National Electrical Code (NEC), there are four types of backup or standby power systems: Emergency Systems, Legally Required Standby Systems, Optional Standby Systems and Critical Operations Power ...
