

# Blocks on photovoltaic panels

## Overview

---

In simplest terms a diode can be understood as a two terminal electronic device, which allows electrical current to pass in One Direction Diodes are made of a semiconductor material, usually silicon, although materials likeselenium and germanium are sometimes used in its construction. A diode only allows.

Diodes are extensively used in solar panel installations. Since the prevent backflow of current (unidirectional flow of current), they are used as blocking devices. They are also used as bypass devices to maintain the reliability of the entire.

Figure 2 shows the simple working of a blocking diode. Electricity flows from high potential to low potential. Figure 2: Blocking diode in solar system In this setup, during the day the.

Figure 3 shows the simple working of a bypass diode. In this setup, one of the solar panel is faulty and is not producing any current. Figure 3: Bypass diode in solar system The bypass.
