

# **Boston energy storage**

## Overview

---

How many energy storage facilities are there in Massachusetts?

The Massachusetts Energy Siting Facilities Board has approved two energy storage facilities with a combined capacity of 400 MW/800 MWh. This decision overturns previous rulings that hindered the development of these facilities. Once operational, they will fulfill 80% of the state's 1 GWh energy storage deployment target for 2025.

Could Boston-area battery companies power electric cars and smart grids?

Formed out of research at MIT, Worcester Polytechnic Institute and other nearby research institutions, these companies are developing technology that could power electric vehicles and smart grids of the future. Venture capital firms are betting big on Boston-area battery companies, too.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Will 4th power build a prototype facility in Boston?

Fourth Power plans to build a prototype facility that can store the equivalent of 1 megawatt-hour — enough energy to power about 1,000 homes — in

Boston, with possible completion in 2026. The company hopes to see its batteries deployed commercially before the end of the decade, Fourth Power Chief Executive Officer Arvin Ganesan said.

How does energy storage work?

The company said its “thermal energy storage technology uses renewable energy to heat carbon blocks to temperatures so hot they glow like the sun,” and then later releases that heat “on demand to the grid as electricity.”
