Cascading Network Failure in Power Grid Blackouts

Examples of a small initial outage cascading into a complicated sequence of dependent outages are the August 10, 1996, blackout of the Northwest United States that disconnected power to about 7.5 million customers (Kosterev et al. 1999), the August 2003).

The interactions between mid-term and long-term dynamics account for most of the time in the cascading outage process. Considering the related dynamics as shown in Fig. 6.1, the quasi-dynamic simulation procedure can be regarded as a loop of MTROs and re-dispatch operations accompanied with long-term system state changes (e.g., load variations).

Cascading failures are often identified as the primary initiating mechanism for widespread blackouts and one of the biggest threats faced by the power system. 6, 11, 12 Cascading events occur as a sequence of failures where one failure leads to the next, governed by the complex interactions between the system components and operations 13 (see Note S5 ...

Industrial Practices and Criteria Against Cascading Failures

Cascading failures in power systems occur when an initial outage, or combination of outages, triggers the successive outage of multiple system elements [1]. Initial outage may include component failure due to aging, natural disasters, poor component design or operating settings, and transmission line or generator outages [2, 3].

When assessing the risk of cascading outages of power system, a common method is to search the fault chains with risk continuously through cascading outage simulation. However, in large systems, large amount of fault chains bring difficulties to risk assessment. In this paper, a cascading outage risk assessment strategy based on deep reinforcement learning is proposed. ...

Expose hidden failures to prevent cascading outages [in power systems] Abstract: Major blackouts are rare events, but their impact can be catastrophic. A study of significant disturbances reported by NERC in the period from 1984 through 1988 indicates that protective relays are involved in one way or another in 75 percent of major disturbances.
