

# Charging voltage of lithium ion battery

## Overview

---

The charging voltage for a lithium battery depends on the battery voltage and the charging stage<sup>12345</sup>. Here are some examples: A 12V lithium battery typically requires 13-14 volts during charging<sup>25</sup>. Aim for a range between 14.2V and 14.6V with bulk and absorption stages; for the float stage, 13.6V is best<sup>1</sup>. The full charge voltage of lithium-ion batteries is usually around 4.2 volts per cell<sup>3</sup>. When charging, the difference between the battery voltage and the maximum charging voltage is less than 100mV and the charging current is decreased to C/10, the battery is deemed fully charged<sup>4</sup>. What voltage is a lithium ion battery?

A lithium-ion battery's nominal or standard voltage is nearly 3.60V per cell. Some battery manufacturers mark lithium-ion batteries as 3.70V per cell or higher. What voltage is overcharged on a lithium battery?

Overcharging means charging the lithium-ion battery beyond its fully charged voltage.

What is the relationship between voltage and charge in a lithium-ion battery?

The relationship between voltage and charge is at the heart of lithium-ion battery operation. As the battery discharges, its voltage gradually decreases. This voltage can tell us a lot about the battery's state of charge (SoC) – how much energy is left in the battery. Here's a simplified SoC chart for a typical lithium-ion battery:.

What does overcharging a lithium ion battery mean?

Overcharging means charging the lithium-ion battery beyond its fully charged voltage. When the charge exceeds 3.65V, it is known to be overcharged. Voltage is one of the most important considerations one must keep in mind when buying a lithium-ion battery.

What is the state of charge of a lithium ion battery?

State of charge (SoC) is the charge level of an electric battery relative to its

capacity. It is generally expressed in percentages. The SoC of lithium-ion batteries lies between 0 to 1. Power density and energy density are the two most common concepts associated with lithium-ion batteries.

What happens when a lithium ion battery is plugged into a charger?

When a lithium-ion battery is plugged into the charger, charging continues until 100% of the state of charge is reached. The charge is then terminated, and the Li-ion battery is allowed to slowly discharge. In Li-ion cells, the relationship between SoC and voltage is relatively flat throughout the cell's discharge range.

Can a PC charge a lithium ion battery?

Another research that employed a PC approach for charging lithium-ion batteries is described in , in which the lithium saturation is avoided by correctly selecting the parameters, allowing significantly higher rates of charging.
