How will microgrids impact Japan's Energy Future?

As microgrids appear across the country, they will play an increasingly important role alongside the grid system to deliver clean and reliable power. Japan is currently aiming for 22%-24% of its energy to be produced by renewable sources by 2030, which will include 64GW of solar power.

When did microgrids start in Japan?

The first microgrids in Japan were New Energy and Industrial Technology Development Organization-financed projects initiated in Aichi, Kyoto and Hachinohe in 2003. A variety of energy sources were tested, in particular gas engines, and their success was demonstrated in the years that followed.

What are the research prospects for a microgrid?

Finally, future research prospects in long-term low-cost energy storage, power/energy balancing, and stability control, are emphasized. 1. Introduction A microgrid is a power grid that gathers distributed renewable energy sources and promotes local consumption of renewable energies .

Why are microgrid systems becoming more popular in Japan?

The success of projects such as Higashi Matsushima eco city has increased the popularity of microgrid systems in Japan. In August 2017, the Cabinet Office announced it would be increasing National Resilience Programme funding by 24%, as of April 2018.

Does Japan need a microgrid?

The 9.0 magnitude earthquake, which hit off the coast of Sanriku, caused vast amounts of damage to Japan's energy infrastructure, increasing the need for the project roll-out. "It has been accelerated due to the 2011 Great East Japan disaster, and about JPY45bn of funding has been granted" for further development of microgrids, says Kashiwagi.

What is a microgrid?

The term “microgrid” refers to the concept of a small number of DERs connected to a single power subsystem. DERs include both renewable and /or conventional resources . The electric grid is no longer a one-way system from the 20th-century . A constellation of distributed energy technologies is paving the way for MGs , , .
