Why do we need a power distribution system?

With these systems in place, electricity is divided up and distributed efficiently across different feeders. Also by adopting this strategy the lines don't get overloaded during peak demand periods and resources are used more effectively as a whole.

What are the disadvantages of a radial distribution system?

A major drawback of a radial distribution system is, a fault in the feeder will result in supply failure to associated consumers as there won't be any alternative feeder to feed distributors. The above-mentioned disadvantage of a radial system can be minimized by introducing parallel feeders.
