

Distribution optimization and application in power systems

Overview

What is a power distribution optimization Handbook?

This handbook gathers state-of-the-art research on optimization problems in power distribution systems, covering classical problems related to the expansion and operation planning of distributed networks as well as the challenges introduced by distributed power generation and smart grid resources.

How does distributed optimization work?

In the distributed optimization framework, a large-scale power system is divided into small-scale sub-regions, and subproblems for individual sub-regions can be efficiently solved and effectively coordinated to obtain a final solution to the original problem.

Is distributed optimization a viable alternative to centralized optimization?

Distributed optimization, as an alternative approach to solve challenges of the centralized optimization mechanism, has attracted increasing attention recently. This paper reviews existing works on distributed optimization for power systems operation.

Can distributed algorithms solve power system operation problems?

Since the applications of distributed algorithms in practical cases largely rely on the high performance computing (HPC) platform, the application of HPC techniques on power system operation problems is also reviewed.

What is distributed optimization in HPC?

Indeed, distributed optimization provides a decomposition structure that perfectly suits for HPC. In distributed optimization framework, local subproblems can be directly distributed to individual processing units, e.g. individual cores of a multi-core CPU or individual stand-alone computers in a cloud network of multiple computers.

How are distributed methods applied in power systems operation?

Based on the type of information being exchanged, distributed methodologies applied in power systems operation can be divided into two categories. The first set of methods is generator-based decomposition, which exchanges price/cost information of individual generators.
