

# Does hydrogen fuel require lithium battery energy storage

## Overview

---

Are hydrogen fuel cells better than lithium-ion batteries?

On the surface, it can be tempting to argue that hydrogen fuel cells may be more promising in transport, one of the key applications for both technologies, owing to their greater energy storage density, lower weight, and smaller space requirements compared to lithium-ion batteries.

Is hydrogen a better energy storage option than a battery?

On the other hand, energy storage in hydrogen has a much lower round-trip efficiency than batteries, resulting in significant energy losses during operation. Even at its present-day round-trip efficiency of 30%, however, it can provide the same overall energy benefit as batteries when storing overgeneration from wind farms.

Are Li-ion batteries and hydrogen fuel cells the future of energy?

In the ongoing pursuit of greener energy sources, lithium-ion batteries and hydrogen fuel cells are two technologies that are in the middle of research booms and growing public interest. The li-ion batteries and hydrogen fuel cell industries are expected to reach around 117 and 260 billion USD within the next ten years, respectively.

Are lithium-ion batteries suited for energy storage over different durations?

Therefore, a combination of energy storage technologies suited for storage over different durations may be necessary to ensure reliable, cost-effective operation. Lithium-ion batteries (LIBs) and hydrogen (H<sub>2</sub>) have emerged as leading candidates for short- and long-duration storage, respectively.

Are lithium-ion batteries the future of energy?

As such, lithium-ion batteries are now a technology opportunity for the wider energy sector, well beyond just transport. Electrolysers, devices that split water into hydrogen and oxygen using electrical energy, are a way to produce

clean hydrogen from low-carbon electricity.

Can a hydrogen fuel vehicle be powered by a fuel cell?

For hydrogen fuel vehicles, the hydrogen in the tank must be reconverted into electric power, which is done through fuel cell. According to the U.S. Department of Energy, the fuel cell technology has the potential of achieving 60% of efficiency, with most of the rest of the energy lost as heat (U.S. Department of Energy, 2011).
