

# **Does the electromagnetic gun use lithium batteries to store energy**

## Overview

---

What is an electromagnetic railgun?

As its name suggests, an electromagnetic railgun utilizes electromagnetic energy to launch its projectiles. This makes it closer in design to a large electric circuit than a gun. A railgun has three main components: a power supply, rails, and armature. The power supply is what delivers current to the railgun.

How much energy does an electromagnetic railgun use?

Japan ATLA's medium-sized electromagnetic railgun prototype can fire 40 mm steel projectiles weighing 320 grams each, judging by the weapon's specifications. ATLA intends to eventually run its gun on 20 megajoules (MJ) of charge energy.

How much energy does an electric weapon use?

mical energy, but it is released very slowly when we eat it. Many electric weapons require peak powers of more than a gigawatt (GW) or energies more than a megajoule. The time scales for delivery range from milliseconds to nanoseconds. As an example, delivering 1 MJ of energy in 10  $\mu$ s requires 100 GW of po.

Can electromagnetic guns be used in the future?

True Believer: Harry D. Fair, director of the Institute for Advanced Technology, has for the past three decades championed research into electromagnetic guns. Refining the technology has proved thorny, but renewed interest in the United States, China, and elsewhere could finally lead to usable systems in the near future.

Is the military interested in electromagnetic guns?

In the United States, the military's interest in electromagnetic guns has revived, as has funding, with about \$30 million per year now coming from the

Army and the Navy. The Navy is interested in the technology for its next generation of all-electric ships.

How much energy does a 90 mm rail gun store?

The British Ministry of Defense built a 32 MJ capacitive energy storage pulse power supply system for the 90 mm caliber electromagnetic rail gun, which can output 3.6 MA current. The system consists of 29 modules that can be independently triggered and store 1.1 MJ of energy.
