

# **Does the installation of photovoltaic panels in the east have a big impact**

## Overview

---

A system facing east or west tends to get around 15-20% less energy than one facing directly south. How do solar panels affect electricity production?

Consequently, the angle and direction of your solar panels will have a big impact on how much electricity they can produce. The angle of a solar panel refers to how many degrees of variance it is from horizontal, and the orientation of a solar panel refers to how many degrees of variance it is from south.

Do solar panels generate more electricity?

The size of the solar installation is a big factor affecting electricity generation. Although it will cost more upfront to install more panels, a larger solar panel system will always generate more electricity. However, if you generate more than you can use during the day, you'll need a storage battery to make the most of it.

What is a solar photovoltaic system?

Solar photovoltaic is a renewable energy technology that utilizes sunlight in order to generate electricity. A photovoltaic system is comprised of one or multiple solar panels, made up of solar photovoltaic cells, and a solar inverter.

Does a solar PV system generate more electricity a year?

A solar PV system on the south coast of England for example will generate more electricity annual than one of a similar size, orientation and inclination in the north of Scotland. A solar PV system on the south coast of England for example will generate more electricity annually.

Should solar panels face east or west?

Panels facing east will make more electricity in the morning, while those facing the west will generate more power in the afternoon and evening.

However, if you only have space on your rooftop for north-facing solar panels, it's normally not worth going ahead with the installation.

Are solar panels more productive than a south-facing system?

Depending on the location, they can sometimes be more productive than south-facing systems. Somewhere around 35 degrees is the best compromise for maximum electricity generation throughout the year. Your solar panel positioning can have a huge impact on your system's output.
