Use MATLAB to plot the high-side terminal voltage as a function of the power-factor angle as the load power factor varies from 0.6 leading through unity power factor to 0.6 pf lagging. Example 4: A single-phase load is supplied through a 35-kV feeder whose impedance is $95 + j 360 \Omega$ and a 35-kV:2400-V transformer whose equivalent impedance is $(0.23 + j 1.27) \Omega$ referred to its low ...
