

# Energy storage system simulation calculation case

## Overview

---

What is energy storage simulation?

A unique simulation framework offering detailed analysis of energy storage systems. Different storage technologies are covered including aging phenomena. Various system components are modeled which can be configured to a desired topology. The tool offers configurable energy management and power distribution strategies.

What is the Simses simulation & analysis tool for energy storage systems?

Within this work, the simulation and analysis tool for energy storage systems SimSES is presented. SimSES provides a library of state-of-the-art energy storage models by combining modularity of multiple topologies as well as the periphery of an ESS. This paper summarizes the structure as well as the capabilities of SimSES.

What is the average model of the energy storage unit (ESS)?

Average model of the ESS. In this model, the whole power converter interface of the energy storage unit is replaced by ideal voltage sources, which reproduce the averaged behavior of the VSC legs during the switching interval.

Does energy storage need a dynamic simulation tool?

For energy storage applications focused on improving the dynamic performance of the grid, an electromechanical dynamic simulation tool is required to properly size and locate the energy storage so that it meets the desired technical performance specifications.

How can energy storage models be implemented?

It should be noted that by analogy with the BESS model, the SC, FC and SMES models can be implemented considering their charging and discharging characteristics. In addition, by applying a similar approach to the design of the

energy storage model itself, they can be implemented in any other positive-sequence time domain simulation tools.

Which storage systems are simulated in this case study?

In this case study, three different storage systems are simulated: a LIB system with 150 kWh, a RFB system with 200 kWh, and a hybrid system with 10 kWh LIB capacity and 180 kWh RFB capacity. More detail on the system configuration chosen for this case study is given in Fig. 10.
