## Overview

---

What are thermal energy storage processes?

Thermal energy storage processes involve the storage of energy in one or more forms of internal, kinetic, potential and chemical; transformation between these energy forms; and transfer of energy. Thermodynamics is a science that deals with storage, transformation and transfer of energy and is therefore fundamental to thermal energy storage.

What are the different types of thermal energy storage units?

TES units can be classified into different types according to various characteristics, as shown in Fig. 3. Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage.

What is pumped thermal energy storage (PTES)?

Pumped thermal energy storage (PTES) utilizes an electrically driven heat pump during charging to create two distinct heat storage reservoirs. During discharging, this temperature difference is used to operate a thermal cycle.

What is thermochemical heat storage?

Thermochemical heat storage is a technology under development with potentially high-energy densities. The binding energy of a working pair, for example, a hydrating salt and water, is used for thermal energy storage in different variants (liquid/solid, open/closed) with strong technological links to adsorption and absorption chillers.

Why is thermal energy storage important?

Thermal energy storage (TES) is increasingly important due to the demand-supply challenge caused by the intermittency of renewable energy and waste heat dissipation to the environment. This paper discusses the fundamentals and novel applications of TES materials and identifies appropriate TES

materials for particular applications.

What is a heat transfer concept?

Storage concepts for solids The heat transfer concept of storage systems using solid materials is usually based on an additional HTF (e.g., water, steam, air, oil, and molten salt) for charging and discharging.

## Thermal Energy Storage

2.1 Physical Principles Thermal energy supplied by solar thermal processes can be in principle stored directly as thermal energy and as chemical energy (Steinmann, 2020) The direct storage of heat is possible as sensible and latent heat, while the thermo-chemical storage involves reversible physical or chemical processes based on molecular forces.
