

# Fengjun 7 generator fault light flashes

## Overview

---

Why does my Generator keep flashing?

Another possible cause of the overload light staying on or flashing could be an issue with the generator's engine. If the engine is not running properly, it can cause the generator to overload, which will trigger the overload light. You may need to have the engine checked by a professional to determine the cause of the problem.

What if all the lights are flashing at the same time?

When all of the lights are flashing at the same time, this means that the exercise time is not set. 1. Ensure that utility power is present. 2. Set the AUTO/OFF/MANUAL switch to the AUTO position. 3. Press and hold the SET EXERCISE button for several seconds. 4. All the red LEDs should stop flashing immediately and the generator should start. 5.

What does a fault light mean on a generator?

**AC Sensing Loss** The fault lamp illuminates yellow and the alarm horn sounds when the controller does not detect the nominal generator set AC output voltage after crank disconnect. The controller displays AC Sens Loss Warning.  
**Battery Charger Fault** The fault lamp illuminates yellow and the alarm horn sounds when the battery charger malfunctions.

How do I know if my generator is overloaded?

Humming or changing in sound patch is also a symptom of generator overload. produce smoke or spark from the vent. Tripp the circuit breaker or the generator going off. Overload light flashing. You may try this easy fix: In 40% of cases, the generator can be recovered from overloading with just a quick reset.

What does a green light mean on a generator?

**Green (A):** The "Ready" status, illuminates when the utility is present and the

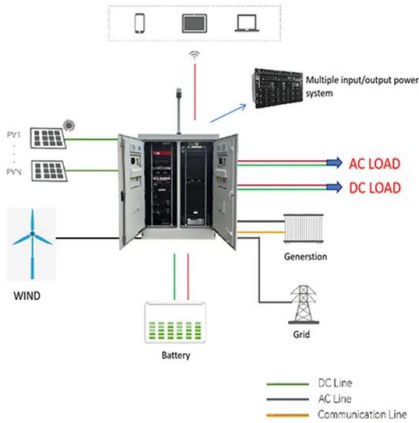

unit is in auto. This light also flashes when there is an outage and the unit is running. Red (B): The "Alarm" status, illuminates when the generator is OFF or a shutdown alarm is detected. Most alarm codes require an authorized service dealer to address.

How do you fix an overloaded generator?

One of the easiest ways to fix an overloaded generator is to turn it into Eco mode. This will reduce the amount of power generated by the generator and allow it to run more efficiently. Resetting the inverter generator can also help solve the overload problem.
