## Overview

---

Overheating is a dangerous problem for generators because it can cause damage to the internal components, reduce efficiency, increase fuel consumption, and create safety hazards. It can also cause the alternator to overheat which will damage the internal insulation. Generators are designed to produce electrical power.

You should not splash water on an overheated generator. Doing so could cause electrical shock, damage to the generator, and even personal injury. When a generator overheats, it's typically because of a.

What causes a generator to overheat?

One problem is the potential for overheating. Overheating can be caused by a low level of coolant, improper use, or a problem with the generator. Why is an overheating generator a bad thing?

If the generator starts overheating, the alternator will overheat, and it will burn out the windings affecting their insulating properties.

Can a diesel generator overheat?

Diesel powered generators are known for their fuel efficiency, reliability and long life-span. However, that does not mean they do not experience problems starting and running. One problem is the potential for overheating. Overheating can be caused by a low level of coolant, improper use, or a problem with the generator.

How do I prevent my Generator from overheating?

Other than regular servicing, here are other things you should do to prevent your generator from overheating.

- Keep both the coolant and oil levels at their correct levels.
- Monitor the exhauster to make sure that it is not blocked.
- Place the generator in a protected but well-ventilated area.

Can a broken cooling fan cause a generator to overheat?

A broken cooling fan will cause the generator to overheat, prohibiting air

circulation. Diesel injectors can become clogged, which causes the system to overload as it tries to work harder to get fuel. When the exhaust element is damaged or blocked, the heat and fumes can collect in the generator and cause it to overheat and cause a fire.

Can a generator overheat in the Sun?

Yes, in the direct sun, at temperatures over 90 degrees, the metal of a generator can reach temperatures of 120 degrees. When combined with the engine's internal temperature, this can cause the generator to overheat. If possible, create a shelter with a tarp or tent to protect the generator from the sun.

Can a clogged exhaust pipe cause a generator to overheat?

Due to snow, dust, debris, and birds' nest, the exhaust can be blocked. It could cause severe overheating. Always check the exhaust pipe before starting your generator. Check out my article on how to safely run a generator in a garage as well. Clogged and dusty air filter becomes dry resulting in the blockage of air.
