

Flow battery technology

Overview

A flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Ion transfer inside the cell (accompanied by current flow).

The (Zn-Br₂) was the original flow battery. John Doyle file patent on September 29, 1879. Zn-Br₂ batteries have relatively high specific energy, and were.

Redox flow batteries, and to a lesser extent hybrid flow batteries, have the advantages of: • Independent scaling of energy (tanks) and power (stack), which.

The hybrid flow battery (HFB) uses one or more electroactive components deposited as a solid layer. The major disadvantage is that this reduces.

Other flow-type batteries include the , the , and the . MembranelessA membraneless battery relies on in which.

A flow battery is a rechargeable in which an containing one or more dissolved electroactive elements flows through an .

The cell uses redox-active species in fluid (liquid or gas) media. Redox flow batteries are rechargeable () cells. Because they employ rather than or they are more similar to .

Compared to inorganic redox flow batteries, such as vanadium and Zn-Br₂ batteries. Organic redox flow batteries advantage is the tunable redox properties of its active components.
