What is a double-fold blade wind turbine?

The double-fold blade wind turbine in the current study consists of three numbers of blades and a downwind configuration. The mentioned blade design derives from the simplification of the geometry of the Borneo camphor seed wings. The oblique fold characteristics of the wings were observed to be located at the wing roots of the seed.

What is the maximum power coefficient of a folding blade wind turbine?

The results show that in a configuration with a  $50^\circ$ -fold axis angle and  $3.834^\circ$  pitch angle, the maximum power coefficient of the folding blade wind turbine is 28.22% higher when compared to the reference wind turbine.

Are flexible blade wind turbines better than rigid blades?

The results show that the maximum power coefficient of the flexible blade wind turbine is higher than that of the rigid blade counterpart. The time taken for startup and yawing for the flexible-blade wind turbine was shorter than that of the rigid-blade wind turbine, indicating a better performance of the flexible blades.

Do blade sections affect wind turbine performance?

Another study in adopted flat-plate blade sections into the wind turbine, which have a maximum power coefficient of 0.0870. These studies showed that the effect of blade sections on power performance is significant, given the large differences in power coefficients.

Do double-fold blade wind turbines have grid independence?

Another grid independence test was done on one of the proposed double-fold blade wind turbines (case 5). The same mesh refinement properties of the coarse, medium, and fine meshes were applied to the proposed double-fold blade wind turbine case.
