

Grid Microfilm Together

Overview

How are microbial cells fixed in a biofilm?

In biofilms intended for industrial applications (biofilm reactors), microbial cells are fixed on different supports by adsorption, entrapment, or covalent bond formation. Adsorption uses the natural ability of bacterial cells to adhere to a support (such as charcoal, resin, vermiculite, sand particles, polypropylene).

What is the role of the secreted matrix in biofilm architecture?

The secreted matrix, a ubiquitous and defining feature of biofilms, has a central role in organizing local and global biofilm architecture 143 as well as the spatial arrangement of cell lineages 2, 17, 144.

How complex are microbial biofilms?

The study of biofilms has revealed their vast complexity both in terms of resident species composition and phenotypic diversity. Despite this complexity, theoretical and experimental work in the past decade has identified common principles for understanding microbial biofilms.

Can light sheet microscopy be used for 3D multichannel imaging of biofilms?

Light sheet microscopy in a special configuration (dual-view selective plane illumination microscopy (D-SPIM); Table 1) may enable 3D multichannel imaging of large biofilm areas, including the biofilm matrix landscape 156. Similarly, mesolens microscopy will provide insights into both large areas as well as fine structures in biofilms 157.

What genes are over-expressed in the biofilm compared to planktonic cells?

Accordingly, several genes involved in iron acquisition are over-expressed in the biofilm compared to planktonic cells. The down-regulation of DNA repair genes in biofilm cells indicates that the frequency of spontaneous mutations, and therefore of novel genetic traits, is elevated within the biofilm .

What are biofilms & microbiomes 7?

npj Biofilms and Microbiomes 7, Article number: 80 (2021) Cite this article
Biofilms are organised heterogeneous assemblages of microbial cells that are encased within a self-produced matrix. Current estimates suggest that up to 80% of bacterial and archaeal cells reside in biofilms.
