## Overview

Does proximity to populated areas affect solar PV power plant site selection?

Proximity to populated areas is considered widely in the literature as a determining factor for the site selection problem for solar PV power plant (Halder et al. 2021). When the solar PV power plant is near populated areas, the energy transmission cost is reduced; however, this may adversely affect the environment.

Why is site-selection of solar photovoltaics (PV) and concentrated solar power (CSP) important?

Scientific research on the site-selection procedures of solar photovoltaics (PV) and concentrated solar power (CSP) technologies is of significant importance, contributing to environmentally sustainable, technically and economically viable, and socially acceptable solar energy projects.

What is a solar photovoltaic & wind turbine hybrid generation system?

A solar photovoltaic, wind turbine and fuel cell hybrid generation system is able to supply continuous power to load. In this system, the fuel cell is used to suppress fluctuations of the photovoltaic and wind turbine output power. The photovoltaic and wind turbines are controlled to track the maximum power point at all operating conditions.

What is the progress made in solar power generation by PV technology?

Highlights This paper reviews the progress made in solar power generation by PV technology. Performance of solar PV array is strongly dependent on operating conditions. Manufacturing cost of solar power is still high as compared to conventional power. Abstract.

How to determine site suitability for solar PV power plant?

Distance to transmission lines is an essential criterion determining the site suitability for solar PV power plant because long distances to transmission

lines incur extra cost (Uyan 2017). Close proximity to the transmission line can reduce energy losses (Sharma and Singh 2018).

How to choose a solar power plant site?

This aspect needs to be considered while selecting the sites for a solar power plant. Most photovoltaic modules work best under 15 to 23 °C of average temperature (Hamou 2014). Suppose the system is desired to be installed in the region where the average temperature is below the threshold. In that case, it will further increase the cost.
