

## Overview

---

In a perfect world, the average roof in the U.S. can generate around 35,000 kilowatt-hours (kWh) of solar electricity annually—far more than the average home’s annual electricity usage of 10,600 kWh. What is a rooftop solar power system?

A rooftop solar power system, or rooftop PV system, is a photovoltaic (PV) system that has its electricity -generating solar panels mounted on the rooftop of a residential or commercial building or structure.

Will my roof generate solar energy?

Realistically, your roof’s solar generation potential will be less than that. It’ll likely still exceed your typical household energy needs, but real-world constraints like roof space, sunlight exposure, and equipment specifications play a huge role in your panels’ actual generation.

Are roofs good for solar energy harvesting?

The unique properties of roofs, such as good sunlight incidence, good ventilation conditions, no redundant shielding, and flexible tilt angle for PV panels, are advantageous for solar energy harvesting. Accordingly, roofs present the highest efficiency potential for PV generation systems in buildings (Lin et al., 2014).

Can rooftop solar panels meet our energy needs?

We have published research by the UCL Energy Institute into the true potential for meeting our energy needs if we made full use of the rooftop space available for solar panels across the country.

How much solar power does a roof use a year?

Truthfully, way more than you probably need. According to our calculations, the average roof can produce about 35,000 kilowatt-hours (kWh) of solar electricity annually—more than three times the amount of electricity the

average U.S. home uses annually.

Can solar power be installed on roofs and facades?

Fig. 1. New installed capacity of renewable energy technologies globally from 2011 to 2021. Building PV generation systems can be applied on roofs (Kumar et al., 2018) and/or facades (Quesada et al., 2012), and the installed PV generation system can share the grid load.
