How does home solar power work?

Here's a step-by-step overview of how home solar power works: Excess solar energy is stored in batteries or pushed onto the grid to power local systems (like your neighbor's house!) Now that we've covered the basics, let's break down how solar panels work in more detail. How does solar power work?

The photovoltaic effect explained.

How do solar panels work?

When the sun shines on a solar panel, solar energy is absorbed by individual PV cells in the panel. These cells are made from layers of semi-conducting material, most commonly silicon. The PV cells produce an electrical charge as they become energised by the sunlight. This electrical charge creates a direct current (DC) of electricity.

Can solar panels generate electricity?

Yes, it can - solar power only requires some level of daylight in order to harness the sun's energy. That said, the rate at which solar panels generate electricity does vary depending on the amount of direct sunlight and the quality, size, number and location of panels in use.

How do solar panels turn sunlight into electricity?

Solar panels turn sunlight into electricity through the photovoltaic (PV) effect, which is why they're often referred to as PV panels. [How Do Solar Panels Power Your Home?](#)

The photovoltaic effect occurs when photons from the sun's rays hit the semiconductive material (typically silicon) in the cell of the solar module.

How do solar cells produce electricity?

Solar cells convert the light from the sun into electricity. Many solar cells can be put together to make a solar panel. Solar cells are made from a material called silicon. – Solar panels are used to produce electricity. They can be found on buildings but can also be used on a solar farm to harvest the power of the sun.
