

How does solar energy source work

Overview

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

.

How do we use solar energy?

There are two key ways of capturing and using this energy from the Sun: solar panels (photovoltaics), which convert light into electricity, and solar thermal power, which transforms the Sun's energy into heat.

How is solar energy produced?

Solar energy is the light and heat that come from the sun. To understand how it's produced, let's start with the smallest form of solar energy: the photon. Photons are waves and particles that are created in the sun's core (the hottest part of the sun) through a process called nuclear fusion.

How does a solar power plant use energy?

The resulting flow of electrons forms a small electrical current in each cell. Another way of capturing the Sun's energy is converting it into heat. Concentrating solar-thermal power plants, for instance, use mirrors and lenses to reflect and focus sunlight to heat water or other liquids.

How do solar panels turn sunlight into electricity?

There are several ways to turn sunlight into usable energy, but almost all solar energy today comes from "solar photovoltaics (PV)." Solar PV relies on a natural property of "semiconductor" materials like silicon, which can absorb

the energy from sunlight and turn it into electric current.

How does a solar power grid work?

An electric grid with lots of solar power must pair it with other technologies for reliability: energy sources like hydropower that can be powered up and down at will, energy storage (like batteries) to save up solar energy when it's plentiful, and/or long-distance transmission to move electricity from the sunniest spots to where it's needed.

Solar power

Solar power plants use one of two technologies: Photovoltaic (PV) systems use solar panels, either on rooftops or in ground-mounted solar farms, converting sunlight directly into electric power. Concentrated solar power (CSP) systems use mirrors or lenses to concentrate sunlight to extreme heat to make steam, which is converted into electricity by a turbine.
