## Overview

What is compressed air energy storage?

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

Where is compressed air stored?

Ideally the compressed air is stored in an existing geographical formation such as a disused hard-rock or salt mine (keeps cost down), rather than producing specialist surface piping, which can be expensive. How does compressed air energy storage work?

The first compressed air energy storage facility was the E.ON-Kraftwerk's.

How much does a 'CAES' energy store cost?

'CAES has the potential to be the lowest-cost mass-energy store with costs per unit of energy stored in the order of £1/kWh-£10/kWh if you use nature to help you store the air. Pumped hydro typically comes in above £50/kWh and most electrochemical stores are more like £500/kWh of capacity.

Can compressed air energy storage help the UK achieve energy goals?

It is expected that the UK will need to be able to store about 200GWh of electricity by 2020, to help support the grid that becomes more dependant on intermittent renewable energy sources. Compressed air energy storage could be a valuable tool in allowing us to hit these ambitious targets.

How long can A CAES store energy?

The CAES can only store energy for about 8 hours, making it useful for short-term storage of large amounts of excess renewable energy on a windy or

particularly sunny, but less practical than pumped storage hydropower and even lithium-ion for the long term.

Can liquid air energy storage be used for large scale applications?

A British-Australian research team has assessed the potential of liquid air energy storage (LAES) for large scale application.
