How does a solar system work?

The PV system has several components to store and power your home. The solar panels are placed on the roof, and the number of panels and the wattages will depend on the power you need for your home. The panels are connected, and the combined power and DC electricity is converted to AC and supplied through your home.

How do solar panels create electricity?

But if you want to go a bit deeper into the process of how solar panels create electricity, we'll explain what you should know. Solar cells are typically made from a material called silicon, which generate electricity through a process known as the photovoltaic effect.

What is solar energy & how does it work?

The solar resource is enormous. Just 18 days of sunshine on Earth contains the same amount of energy as is stored in all of the planet's reserves of coal, oil, and natural gas. Solar photovoltaic (PV) panels are based on a high-tech but remarkably simple technology that converts sunlight directly to electricity.

How does a solar inverter work?

Solar inverters convert DC electricity into AC electricity, the electrical current appliances run on when plugged into a standard wall socket. Other types of solar technology include solar hot water and concentrated solar power. They both use the sun's energy but work differently than traditional solar panels.

How do solar cells work?

Here's how it works: There are two layers of silicon in solar cells. Each one is specially treated, or "doped," with phosphorus and boron to create positive and negative sides of the solar cell, respectively. When photons hit the solar cells they create an electric field at the junction between the layers.

How do solar panels convert solar energy into heat?

Instead, the solar panels, known as "collectors," transform solar energy into heat. Sunlight passes through a collector's glass covering, striking a component called an absorber plate, which has a coating designed to capture solar energy and convert it to heat.
