

How thick is the fan cylinder of the power generation fan

Overview

What psi should a fan operate at?

As a general rule, fans typically operate at pressures up to about 55 in-wg (2psi) and blowers at between 2psi and 28psi, although custom-designed fans and blowers may operate well above these ranges. Air compressors are used for systems requiring more than 20psi. There are two broad categories of fans: centrifugal and axial.

How to determine the power consumption of a fan?

Decide the power consumption. Since the air volume is estimated for the hot air, the correct volume for the fan is 10000 m³ /h . The pressure coefficient is approximately 1.15 for air at 60 oC according the chart. The correct pressure in the manufacturing data sheet should be The power consumption according the manufacturing data is 2.5 kW .

How big should a fan motor be?

A motor (and the motor protection) should in general be big enough to handle higher start up power consumption. Remember! If a fan starts with temperatures below 20 oC (NTP) - the power consumption will be higher than specified in the catalogue - and the fan may be stopped by the electrical overload protection.

How to choose a fan?

Decide the correct air volume and pressure for choosing a fan from the manufacturers data. Decide the power consumption. Since the air volume is estimated for the hot air, the correct volume for the fan is 10000 m³ /h . The pressure coefficient is approximately 1.15 for air at 60 oC according the chart.

What is the difference between air volume and axial flow fan?

Air Volume- The cubic feet per minute (cfm) of air handled by a fan at any air

density. This is different from the cubic feet per minute of standard air (scfm), which is at 0.075 lb/ft. Axial Flow Fan: A fan in which the flow of air is substantially parallel to the axis of the impeller rotation.

How to adjust the volume of air in a fan?

To accommodate demand changes, the volume of air is adjusted by four principle methods: Outlet or discharge air dampers are installed to add resistance at the fan. As dampers close, they reduce the amount of flow and increase pressure on their upstream side.
