What are we doing about wind power?

The potential of wind power is enormous! Bringing clean energy to power homes across the UK. But what are we doing about it, you ask?

Well, lots, actually! We're investing, innovating and providing some of the much-needed new, affordable, low-carbon electricity to the UK. What is wind power?

Wind is a type of solar energy.

What is wind power?

Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a form of renewable energy. Modern commercial wind turbines produce electricity by using rotational energy to drive a generator.

How can we maximise on excess wind energy?

There are a number of ways that we can maximise on excess wind energy: In order for homes and businesses to use cleaner, greener energy, more renewables – such as wind power and solar power – will need to be connected to the electricity grid.

Why are new solar & wind sites waiting so long?

Some new solar and wind sites are waiting up to 10 to 15 years to be connected because of a lack of capacity in the electricity system. And electricity only accounts for 18% of the UK's total power needs. There are many demands for energy which electricity is not meeting, such as heating our homes, manufacturing and transport.

How is wind used to produce electricity?

Wind is used to produce electricity by converting the kinetic energy of air in motion into electricity. In modern wind turbines, wind rotates the rotor blades, which convert kinetic energy into rotational energy. This rotational energy is transferred by a shaft which to the generator, thereby producing electrical energy.

Does wind energy go to waste?

This means that when wind power is at its peak, the amount of electricity being generated could potentially outstrip the amount that's required by homes and businesses at that particular time. Fortunately, there are solutions to make sure excess wind energy doesn't simply go to waste: 1. Storing energy to be used later
