

# **How to inspect photovoltaic micro inverters**

## Overview

---

How do microinverters work on solar panels?

Microinverters convert the DC electricity from your solar panels into AC electricity on your roof without a separate string inverter. Installers usually mount the microinverters onto the back of the solar panel, but they can also place them next to the panel on your solar racking system.

What happens if a microinverter goes bad?

If something is wrong with one microinverter, only the panel attached to it will shut down instead of the entire system. Diagnosing and fixing issues with microinverters is often quicker than with central string inverters. Microinverters can easily grow with your solar panel system over the years.

What happens if a solar panel or microinverter fails?

Following on from the above, if a solar panel or microinverter experiences a fault, leading to a drop in performance or a complete failure, you can isolate it and the rest of the panels will continue to produce electricity as normal.

Are microinverters worth it?

Modern microinverters last much longer and even come with 25-year warranties, matching the lifespan of most modern solar panels. Since replacing a central inverter can be pricey, microinverters make an excellent case for long-term value. Microinverters are a great choice from the installer's perspective too.

What is the difference between a solar inverter and a microinverter?

Traditional inverters connect to an entire solar array or string, which can be anywhere from a couple to hundreds of individual solar panels. On the contrary, microinverters are connected to each solar module and are usually mounted on the racking system. Traditional inverters are bigger and bulkier, making them difficult to carry and install.

How do I check the status of my microinverter?

The status of each microinverter can be checked after the Powerline Scan is completed. When connected to the system online via the Enphase Cloud, data from the IQ Gateway is transmitted every 15–30 minutes with an Ethernet/Wi-Fi connection, or every six hours with a cellular modem.
