

How to store wind power and photovoltaic power

Overview

Electricity generated from a wind farm will travel to a transmission substation, where it is stepped up to a high voltage in the region of 150-800 kV. It is then distributed along the electricity grid power lines to the consumer. Wind is a form of solar energy, the result of uneven heating of the earth's atmosphere by the sun and.

Through several different storage processes, excess energy can be stored to be used during periods of lower wind or higher demand.

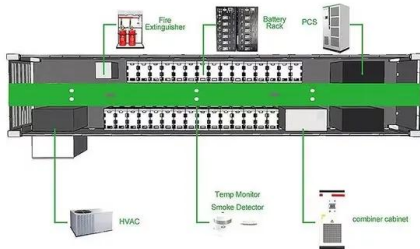

Electrical batteries are commonly used in solar energy applications and can be used to store wind generated power. Lead acid batteries are a suitable.

Hydrogen fuel cells can also be used to store excess energy. A hydrogen generator is used to electrolyse water using power generated.

Wind turbines can use excess power to compress air, this is usually stored in large above-ground tanks or in underground caverns. When required the compressed air can be used through.
