

Images of the planets in order

Overview

There is an ongoing debate about the number of planets in our solar system. The most recent definition of a planet was released in 2006 by the International Astronomical Union.

Not all astronomers and planetary scientists agreed with the definitions, with some seeing them as limiting the number of planets and others finding them incomplete and confusing.

All planets and dwarf planets recognized by the IAU will be included and separated into three categories of planets; Terrestrial, Giant, and Dwarfplanets. 1. Terrestrial Planets: Mercury.

Terrestrial planets include the four closest planets to the Sun located between the Sun and the asteroid belt; Mercury, Venus, Earth, and Mars. Astronomers who use the geophysical definition.

Even though there are only 8 official planets in the solar system, it can be tricky to remember them all in order from the Sun. A popular technique to use a mnemonic, which can be any sentence you want using the first letter of each planet. The letters for each word in the sentence must be M, V, E, M, J, S, U, and N.

There is an ongoing debate about the number of planets in our solar system. The most recent definition of a planet was released in 2006 by the International Astronomical Union (IAU), an organization responsible for classifying astronomical objects. Their definition.

Not all astronomers and planetary scientists agreed with the definitions, with some seeing them as limiting the number of planets and others.
