

Imoli solar power inverter

Overview

Is a solar inverter a converter?

A solar inverter is really a converter, though the rules of physics say otherwise. A solar power inverter converts or inverts the direct current (DC) energy produced by a solar panel into Alternate Current (AC.) Most homes use AC rather than DC energy. DC energy is not safe to use in homes.

How does a solar inverter work?

Also known as a central inverter. Smaller solar arrays may use a standard string inverter. When they do, a string of solar panels forms a circuit where DC energy flows from each panel into a wiring harness that connects them all to a single inverter. The inverter changes the DC energy into AC energy.

Where is a microinverter installed on a solar panel?

The microinverter installation occurs on each panel. Some may be factory installed or physically installed on-site, and there is no central inverter on a solar array with microinverters. The energy conversion occurs at the microinverter—on the roof at each solar panel.

What is the difference between efficiency and oversizing a solar inverter?

Efficiency—is the amount of energy the inverter can supply. Ideally, you want an inverter that is 96% efficient or higher. Oversizing means that the inverter can handle more energy transference and conversion than the solar array can produce.
