## Overview

Will solar power cover a quarter of global electricity needs?

Solar PV could cover a quarter of global electricity needs by mid-century, becoming the second largest generation source after wind. Global capacity must reach 18 times current levels, or more than 8 000 gigawatts by 2050.

Are solar photovoltaic power plants the future of power generation?

Although it currently represents a small percentage of global power generation, installations of solar photovoltaic (PV) power plants are growing rapidly for both utility-scale and distributed power generation applications.

How will solar PV & wind impact global electricity generation?

The share of solar PV and wind in global electricity generation is forecast to double to 25% in 2028 in our main case. This rapid expansion in the next five years will have implications for power systems worldwide.

What is the contribution of solar energy to global electricity production?

While the contribution of solar energy to global electricity production remains generally low at 3.6%, it has firmly established itself among other renewable energy technologies, comprising nearly 31% of the total installed renewable energy capacity in 2022 (IRENA, 2023).

Can photovoltaic power generation improve irrigation systems?

It must be technically and economically feasible to be practical and continuous. Due to weather and solar irradiation, photovoltaic power generation is difficult for high-efficiency irrigation systems. As a result, more precise photovoltaic output calculations could improve solar power systems.

How many merchant solar power plants are there in the world?

At the writing of this guide (early 2015), there were only a few merchant solar

projects in the world; the vast majority of PV power plants are developed using longer-term PPAs. Merchant PV power plants are rare because PV costs typically result in power that is more expensive than other energy sources and excessively risky to financiers.
