Why is lithium-ion battery recycling important?

Lithium-ion battery (LIB) recycling is critical given the continued electrification of vehicles and mass generation of spent LIBs. However, industrial-level recycling is hampered by a variety of factors that make large-scale recycling difficult while maintaining economic viability.

How do you recycle a lithium ion battery?

When a lithium-ion battery is providing power, a cluster of lithium ions moves from one crystalline “cage” (the anode) to another (the cathode). The most common methods currently used to recycle these batteries involve dismantling and shredding the whole battery, then either melting it all down or dissolving it in acid.

Are batteries safe to recycle?

Newer approaches like direct recycling are highly dependent on the efficient sorting of battery types based on a convenient battery labelling with regard to the cell chemistry. For Li-metal and Li-S batteries, the reactivity of the materials and side reactions will bring up some additional safety concerns during recycling.
