

Line diagram of power system

Overview

A typical one-line diagram with annotated power flows. Red boxes represent circuit breakers, grey lines represent three-phase bus and interconnecting conductors, the orange circle represents an electric generator, the green spiral is an inductor, and the three overlapping blue circles represent a double-wound transformer.

In , a single-line diagram (SLD), also sometimes called one-line diagram, is a simplest symbolic representation of an electric power system. A single line in the diagram typically corresponds to.

The lines in the single-line diagram connect nodes – points in the system that are "electrically distinct" (i.e., there is nonzero between them). For sufficiently large systems, these points represent physical , so the diagram nodes are.

When using the method of , separate one-line diagrams are made for each of the positive, negative and zero-sequence.
