

Lithium battery electrolyte additives

Overview

The lowest unoccupied molecular orbital (LUMO) energy levels of DMVC-OCF3 and DMVC-OTMS.

The combination of VC, DMVC-OCF3, and DMVC-OTMS enabled a high discharge capacity of 195.3 mAh g⁻¹ compared with additive-free electrolyte (179.0 mAh g⁻¹) during precyclin.

To explore the suitability of the VC + DMVC-OCF3 + DMVC-OTMS-derived SEI for facilitating Li-ion transport, we evaluated the cycling performance of NCM811/Si-C full cells at high c.

Comparative transmission electron microscopy (TEM) studies of the Si-C anodes with VC after precycling revealed that the Si nanolayer of the Si-C anode undergoes irreve.
