

Lithium battery reaction with water

Overview

Water can trigger hazardous reactions in lithium batteries due to the highly reactive nature of lithium with moisture. When water infiltrates a lithium battery, it instigates a series of detrimental reactions that can lead to heat generation, hydrogen gas release, and potential fire hazards. What is a liquid electrolyte in a lithium ion battery?

Liquid electrolytes in lithium-ion batteries consist of lithium salts, such as LiPF_6 , LiBF_4 or LiClO_4 in an organic solvent, such as ethylene carbonate, dimethyl carbonate, and diethyl carbonate. [135] A liquid electrolyte acts as a conductive pathway for the movement of cations passing from the negative to the positive electrodes during discharge.
