Overview

Mercury is the first planet from the Sun and the smallest in the Solar System. In English, it is named after the ancient Roman god Mercurius (Mercury), god of commerce and communication, and the messenger of the gods. Mercury is classified as a terrestrial planet, with roughly the same surface gravity as Mars.

The ancients knew Mercury by different names depending on whether it was an evening star or a morning star. By about 350 BC, the .

Mercury is one of four in the , which means it is a rocky body like Earth. It is the smallest planet in the Solar System.

• • • • • .

Mercury has the most orbit of all the planets in the Solar System; its eccentricity is 0.21 with its distance from the Sun ranging from.

Mercury's is calculated to vary between -2.48 (brighter than) around and $+7.25$ (below the limit of naked-eye visibility) around . The mean apparent magnitude is 0.23 while the standard deviation of.

Ancient astronomersThe earliest known recorded observations of Mercury are from the tablets. These observations were most likely made by an .

• . NASA. 1978. SP-423. • and from the USGS/IAU Gazetteer of Planetary Nomenclature • May 20, 2016, at the by Applied Coherent.

Mercury position in solar system

Mercury: The Solar System's smallest planet may once have ...

Mercury is a planet of extremes. With a total volume little more than the Moon, it is the smallest planet in the Solar System and is situated the closest to the Sun. Mercury has no atmosphere to

In Depth , Mercury

The smallest planet in our solar system and nearest to the Sun, Mercury is only slightly larger than Earth's Moon. From the surface of Mercury, the Sun would appear more than three times as large as it does when viewed from Earth, and the sunlight would be as much as seven times brighter.

The planet Mercury

Mercury is the smallest planet in the Solar System (Pluto, once the smallest planet is now named as a dwarf planet), and the planet with the most none concentric orbit among the eight planets. ...

The Planets In Order , From The Sun, Information, History

Though we must sadly disconsider Pluto, here are some quick facts about each planet of the Solar System. Mercury Mercury is the closest planet to the Sun. It is only 58 million km / 36 million mi or 0.39 AU away. Though it is the closest, it isn't the hottest

Mercury

Mercury Mercury is the closest planet to the Sun in our solar system. Mercury is the smallest planet in the solar system with a diameter of 3,032 miles, only 435 miles larger than Earth's moon. Mercury is a rocky world with an iron core and a rocky crust. Since

[Position of the planets in the solar system](#)

Position of each of the planets of the solar system (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune) in their orbits with respect to the Sun for any date and time. Position of the planets in real time and accelerated animation of the planetary orbits.

[Mercury: the closest planet to the Sun](#)

Position in the Solar System First planet from the Sun
Diameter Approximately 4,880 km
Time 3.30×10^{23} kg
Gravity 3.7 m/s^2 (38% of Earth's gravity)
Rotation (sidereal day) 59 Earth days
Translation (orbit around the Sun) 88 Earth days
Solar day length 176

Solar system , Definition, Planets, Diagram, Videos, & Facts

4 ???· Solar system, assemblage consisting of the Sun and those bodies orbiting it: 8 planets with about 210 known planetary satellites; many asteroids, some with their own satellites; comets and other icy bodies; and vast reaches of highly tenuous gas and dust known as the interplanetary medium.

Mercury

Mercury is the smallest planet in our solar system and the nearest to the Sun. Mercury is only slightly larger than Earth's Moon. Its surface is covered in tens of thousands of impact craters. Despite its proximity to the Sun, Mercury is not ...

Solar System Facts , Information, Size, History and Definition

The solar system consists of the Sun; the eight official planets, at least three "dwarf planets", more than 130 satellites of the planets, a large number of small bodies (the comets and asteroids), and the interplanetary medium. (There are probably also many more

Mercury: Solar System's Smallest Planet

Mercury completes an orbit around the Sun every 88 Earth days, making it the fastest planet in the solar system. Its rotation on its axis takes 58.7 Earth days, resulting in a day-night cycle longer than its year. Mercury's ...

Solar system planets, order and formation -- a guide , Space

The order of the planets in the solar system, starting nearest the sun and working outward is the following: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune and then

Solar System Facts

Our solar system includes the Sun, eight planets, five dwarf planets, and hundreds of moons, asteroids, and comets. The hottest planet in our solar system is Venus, even though Mercury is closer to the Sun. 5. The largest planet is Jupiter. If Jupiter was a 6.

Planets in Order From the Sun , Pictures, Facts, and ...

Unlike other planets in our solar system, Mercury does not have any moons or rings. Mercury has a very thin atmosphere composed mostly of oxygen, sodium, hydrogen, helium, and potassium. Mercury's surface is heavily cratered. The ...

About the Planets

About the Planets The solar system has eight planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. There are five officially recognized dwarf planets in our solar system: Ceres, Pluto, Haumea, Makemake, and ...

Planet Sizes and Locations in Our Solar System

Mercury is the smallest planet in our solar system. Mercury is a little more than one-third the width of Earth, and has an equatorial diameter of about 3,032 miles (4,880 kilometers). Mercury is the closest planet to the Sun, orbiting at an average distance of 36 million miles (58 million kilometers).

Mercury Facts

Introduction Mercury's surface temperatures are both extremely hot and cold. Because the planet is so close to the Sun, day temperatures can reach highs of 800°F (430°C). Without an atmosphere to retain that heat at ...

Mercury: A complete guide to the closest planet to the ...

Mercury is the closest planet to the sun and also the smallest planet in the solar system. The small and cratered planet does not have any moons and zips around the sun faster than any other

What is Mercurys position in the solar system?

Mercury is the closest planet to the Sun in our solar system. Mercury orbits the sun at an average distance of about 36 million miles (58 million kilometers) is the planet nearest

Solar System Tour

Smallest of the inner terrestrial planets, Mercury has been geologically inactive for billions of years and its surface is peppered with craters of all sizes, including the Caloris Basin, one of the ...

In Depth , Mercury

The smallest planet in our solar system and nearest to the Sun, Mercury is only slightly larger than Earth's Moon. From the surface of Mercury, the Sun would appear more than three times as ...

Mercury (planet)

Mercury is the first planet from the Sun and the smallest in the Solar System English, it is named after the ancient Roman god Mercurius (), god of commerce and communication, and the messenger of the gods. Mercury is classified as a ...

Solar System Scope

Solar System Scope is a model of Solar System, Night sky and Outer Space in real time, with accurate positions of objects and lots of interesting facts. We hope you will have as much fun exploring the universe with our app as do we while ...

[The solar system--facts and information](#)

Our solar system is made up of the sun and all the amazing objects that travel around it. Learn more about the planets, asteroids, and comets in our solar system. Skip to content

The solar system: Facts about our cosmic neighborhood

The solar system is a collection of planets, moons, asteroids, comets, dust and gas that orbit our local star, the sun includes the rocky inner planets Mercury, Venus, Earth and

An orrery is a model of the solar system that shows the positions of the planets along their orbits around the Sun. The chart above shows the Sun at the centre, surrounded by the solar system's innermost planets. Click and drag the chart to rotate the viewing

Solar System Exploration

Learn about the planets in our solar system. The solar system has eight planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. There are five officially recognized dwarf planets in our solar system: Ceres, Pluto, Haumea, Makemake, and Eris.

[Mercury: Size, distance from the Sun, orbit](#)

Size: Mercury is about 3,032 miles (4,880 kilometers) across. That makes it the smallest planet in the solar system. In fact, Mercury is just a little larger than Earth's Moon.

Solar System

Compared to many extrasolar systems, the Solar System stands out in lacking planets interior to the orbit of Mercury. [70] [71] The known Solar System lacks super-Earths, planets between one and ten times as massive as the Earth, [70] although the hypothetical Planet Nine, if it does exist, could be a super-Earth orbiting in the edge of the Solar System.
