## Overview

What is solar-plus-storage?

For solar-plus-storage—the pairing of solar photovoltaic (PV) and energy storage technologies—NREL researchers study and quantify the unique economic and grid benefits reaped by distributed and utility-scale systems. Much of NREL's current energy storage research is informing solar-plus-storage analysis.

How does solar-plus-storage affect energy systems?

Solar-plus-storage shifts some of the solar system's output to evening and night hours and provides other grid benefits. NREL employs a variety of analysis approaches to understand the factors that influence solar-plus-storage deployment and how solar-plus-storage will affect energy systems.

Is energy storage a viable option for utility-scale solar energy systems?

Energy storage has become an increasingly common component of utility-scale solar energy systems in the United States. Much of NREL's analysis for this market segment focuses on the grid impacts of solar-plus-storage systems, though costs and benefits are also frequently considered.

What are the benefits of a multimegawatt solar PV system?

Economically replace a portion of natural gas used for thermal loads and further reduce an installation's CO<sub>2</sub> footprint. Accomplishing these benefits requires multimegawatt BESS with multiday durations coupled to utility-scale solar PV. An on-base utility-scale solar PV requires a large tract of available land.

Can a solar PV system reduce dependence on diesel fuel?

This study found that eliminating dependence on diesel fuel would require 100–400 acres of available land, a requirement easily met at some but not all military installations. The size of the required solar PV can be reduced by

deploying a hybrid system with a small amount of diesel generation.

Can long-duration energy storage (LDEs) meet the DoD's 14-day requirement?

This report provides a quantitative techno-economic analysis of a long-duration energy storage (LDES) technology, when coupled to on-base solar photovoltaics (PV), to meet the U.S. Department of Defense's (DoD's) 14-day requirement to sustain critical electric loads during a power outage and significantly reduce an installation's carbon footprint.
