

# Multi-peak characteristics of series photovoltaic panels

## Overview

---

Does a solar photovoltaic power system have a single peak?

open access Abstract The output power-voltage (P-V) curve of a solar photovoltaic (PV) power system shows a single peak under an even irradiation environment, nevertheless, but often exhibits seriously nonlinear multi-peak characteristics under partial shading conditions (PSCs).

How to track power and voltage characteristic curve of PV panels?

The power and voltage characteristic curve of PV panels shows single peak characteristic with the same light. Conventional tracking algorithms such as Perturb & Observe (P&O) , Increases Conductance (INC) and Mount climbing method can obtain good MPPT effect.

Why does a PV array have a multi-peak characteristic?

However, in practical applications, the PV array is shielded by clouds, trees, buildings, dust, and there are partial shadows and temperature deviations, which cause the power and voltage characteristic curve of the PV system to show multi-peak characteristic . Conventional MPPT algorithms are often trapped in local optimum resulting in failure.

What are the output characteristics of a PV array?

The output characteristics of the PV array indicate that, when the short-circuit current  $I_{SC}$  of the PV array changes with the environment, mainly due to irradiance, the maximum power point current  $I_M$  of the PV array also varies approximately linearly with  $I_{SC}$ .

What is PV maximum power point tracking (MPPT)?

With the expansion of the scale of application of photovoltaic (PV) power generation, PV maximum power point tracking (MPPT) technology has been transformed from uniform environmental conditions (UEC) to partial shading conditions (PSC), but there are certain limitations in the application of existing

technologies under PSC.

What is the optimal P-u characteristic curve of a photovoltaic PV array?

In Fig. 4, when the light intensity of the three modules of the photovoltaic PV array is  $1000 \text{ W m}^{-2}$ ,  $800 \text{ W m}^{-2}$  and  $600 \text{ W m}^{-2}$ , and the standard parameters of each module are 43.6 V, 35 V, 8.35 A, 7.6 A, The optimal extreme point in the P-U characteristic curve is 518.7, and the simulation model established by Simulink is shown in Fig. 6.
