

New Energy Storage Metaverse

Overview

As a new generation of energy storage power stations, the Metaverse-driven energy storage power station fully integrates the emerging digital twin, artificial intelligence technology, interactive technology, advanced communication and perception technology, etc. Aiming at the problems that traditional simulation.

The data source collection completely covers the data of new energy station equipment measuring points and wind measuring towers, including wind power /photovoltaic production.

Based on the principle of meeting performance and requirements, flexible data storage strategies are adopted to optimize data storage costs. Second-level SCADA data, pre.

The data transmission module extracts the data sent by the data perception module, connects to the remote management system driven by the Metaverse, and at the same time transmits the data to the data storage module for.

The data service module provides various data services: 1)Data planning service, which is classified and managed according to the source and use of data in the Metaverse-driven remote.

New Energy Storage Metaverse
