

New Energy and Compressed Air Energy Storage

Overview

Compressed-air-energy storage (CAES) is a way to for later use using . At a scale, energy generated during periods of low demand can be released during periods. The first utility-scale CAES project was in the Huntorf power plant in , and is still operational as of 2024 . The Huntorf plant was initially developed as a load balancer for

Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [,]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air .

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatch and therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

Why do we need compressed air energy storage systems?

With excellent storage duration, capacity, and power, compressed air energy storage systems enable the integration of renewable energy into future electrical grids. There has been a significant limit to the adoption rate of CAES due to its reliance on underground formations for storage.

What is the theoretical background of compressed air energy storage?

Appendix B presents an overview of the theoretical background on compressed air energy storage. Most compressed air energy storage systems addressed in literature are large-scale systems of above 100 MW which most of the time use depleted mines as the cavity to store the high pressure fluid.

How to analyze compressed air energy storage systems?

Analysis of compressed air energy storage systems is usually conducted by taking both compression and expansion stages into consideration using ideal

gas laws. Expanders' mechanical work is first transformed.

What are the different types of compressed air energy storage systems?

Most compressed air energy storage systems addressed in literature are large-scale systems of above 100 MW which most of the time use depleted mines as the cavity to store the high pressure fluid. Three main concepts are researched; diabatic, adiabatic and isothermal.
