

Niu Nan Group Earthquake-resistant Support Photovoltaic Factory

Overview

Do seismic resilient steel structures reduce post-earthquake losses?

Seismic resilient steel structures can significantly reduce (i) post-earthquake losses associated with repair (including direct, interruption, and suspension of building occupation costs), and (ii) the need for building demolition. Owners and occupiers, as well as society at large, benefit from continued building occupancy.

Did rectangular columns overturn in the Nankai earthquake?

Ikegami R, Kishinouye F (1947) A study on the overturning of rectangular columns in the case of the Nankai earthquake on December 21, 1946. Bulletin of the Earthquake Research Institute 25 (1): 49-55.

Are steel buildings earthquake resistant?

Steel structures have long been recognized as excellent earthquake-resistant systems. However, this viewpoint wavered after the 1994 Northridge and 1995 Kobe earthquakes, when thousands of steel buildings experienced local or global damage making them difficult, if not impossible, to repair.

Are ground mounting steel frames suitable for PV solar power plant projects?

In the photovoltaic (PV) solar power plant projects, PV solar panel (SP) support structure is one of the main elements and limited numerical studies exist on PVSP ground mounting steel frames to be a research gap that has not been addressed adequately in the literature.

Are steel structures earthquake-resistant?

Practical applications that have emerged over the last decade are presented. Steel structures have long been recognized as excellent earthquake-resistant systems.

What is the difference between earthquake-resistant systems & post-

earthquake systems?

In conventional earthquake-resistant systems, attention is focused on the response of the structure to code-level seismic demand whereas, in SSD, the post-earthquake attributes of the system are as important as those during the event. SSD is neither part of contemporary curricula nor codes of practice.
