Overview

Here the transistor will be biased so that the maximum amount of base current is applied, resulting in maximum collector current resulting in the minimum collector emitter voltage drop.

Using the transistor values from the previous tutorials of: $\beta = 200$, $I_c = 4\text{mA}$ and $I_b = 20\mu\text{A}$, find the value of the Base resistor (R_b) required to switch the load fully "ON" when t.

Again using the same values, find the minimum Base current required to turn the transistor "fully-ON" (saturated) for a load that requires 200mA of current when the input voltage is in.

We can also use the PNP Transistors as a switch, the difference this time is that the load is connected to ground (0v) and the PNP transistor switches the power to it. To turn the PNP tran.

Here the operating conditions of the transistor are zero input base current (I_B), zero output collector current (I_C) and maximum collector voltage (V_{CE}) which results in a large depletion layer and no current flowing through the device. Therefore the transistor is switched "Fully-OFF".

Here the transistor will be biased so that the maximum amount of base current is applied, resulting in maximum collector current resulting in the minimum collector emitter voltage drop which results in the depletion layer being as small as possible and maximum current.

Using the transistor values from the previous tutorials of: $\beta = 200$, $I_c = 4\text{mA}$ and $I_B = 20\mu\text{A}$, find the value of the Base resistor (R_b) required to switch the load fully "ON" when the input.

We can also use the PNP Transistors as a switch, the difference this time is that the load is connected to ground (0v) and the PNP transistor switches.

Again using the same values, find the minimum Base current required to turn the transistor "fully-ON" (saturated) for a load that requires 200mA of current when the input voltage is increased.

Transistor NPN vs PNP: Difference Between PNP and NPN ...

Converting a PNP transistor circuit to its NPN equivalent involves replacing the PNP transistor with an NPN transistor having similar characteristics and then reversing the power supply polarity. This requires connecting the base, collector, and emitter terminals of the NPN transistor in the same configuration as the PNP transistor in the circuit diagram, and then ...

A Comprehensive Guide to Power Transistors: NPN vs PNP

Power transistors are indispensable components in electronic circuits and play an important role in power amplifiers and switching power supplies. Among the various types of power transistors available, NPN (Negative-Positive-Negative) and PNP (Positive-Negative-Positive) types are the basic building blocks.

How to Operate a Transistor as a Switch

Figure 3. Cut-off Region Characteristics. Image used courtesy of Simon Munyua Mugo The transistor operation is similar to that of a single-pole single-throw solid state switch, where when zero signals are applied at its base, then it remains OFF and in such a situation, it acts as an open switch with zero collector current flowing.

Fading off an LED using NPN BJT

When switched off, a charged capacitor can still provide a current to the Base of a Bipolar Junction Transistor (BJT) through a resistor. But that current quickly lowers over time. The current goes down as the capacitor discharges, which means that it's voltage is lowering. Therefore the BJT will allow less and less current to ... A simple solution is to use a low-side switch instead, with an NPN transistor. Or if you absolutely need a high-side switch you can use a second transistor (NPN) and a pull-up resistor, something like this:

Discrete N-channel-MOSFET driver switching circuit with NPN and PNP

You don't need the PNP if you don't need it to turn on fast. With suitable resistor choices, the PNP provides a large turn-on current. To make it fast without the PNP, the collector resistor for the NPN needs to be small, wasting lots of power and making lots of heat

[NPN vs PNP: What's the Difference?](#)

Bipolar junction transistors come in two different flavors: NPN and PNP. These abbreviations note that they're formed with either a positively-doped semiconducting material sandwiched between two negatively-doped materials in the case of an NPN transistor, or a negatively doped material sandwiched between two positive layers in the case of PNP devices.
