

Photovoltaic ac disconnect placard values

Overview

Where is the AC disconnect located in a solar PV system?

In a solar PV system the AC Disconnect is usually mounted to the wall between the inverter and utility meter. The AC disconnect may be a breaker on a service panel or it may be a stand-alone switch. The AC disconnect is sized based on the output current of the inverter and will be looked at in depth in a different article.

What is the difference between AC disconnect and PV disconnect?

The PV disconnect allows the DC current between the modules (source) to be interrupted before reaching the inverter. The second disconnect is the AC Disconnect. The AC Disconnect is used to separate the inverter from the electrical grid. In a solar PV system the AC Disconnect is usually mounted to the wall between the inverter and utility meter.

What is a safety disconnect in a solar PV system?

A solar PV system typically has two safety disconnects. The first is the PV disconnect (or Array DC Disconnect). The PV disconnect allows the DC current between the modules (source) to be interrupted before reaching the inverter. The second disconnect is the AC Disconnect. The AC Disconnect is used to separate the inverter from the electrical grid.

Does an integrated DC disconnect count as a PV system disconnect?

It's important to note that the integrated DC disconnect on the inverter does not count as a PV system disconnect, since it does not isolate all of the equipment as per the NEC definition - the AC side of the inverter is still connected to the utility load even the DC side of the inverter and the solar panels are disconnected.

What is a PV system disconnect?

The external disconnect, shown as the switch between the inverter and the

electrical panel, may not be a Code or utility requirement for the system per your local authority having jurisdiction (AHJ). If that is the case, the breaker in the electrical panel would be considered the PV system disconnect.

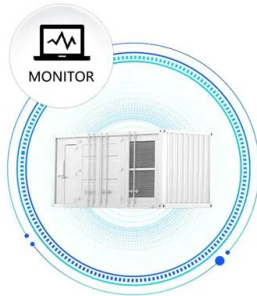

What is the second disconnect in a solar PV system?

The second disconnect is the AC Disconnect. The AC Disconnect is used to separate the inverter from the electrical grid. In a solar PV system the AC Disconnect is usually mounted to the wall between the inverter and utility meter. The AC disconnect may be a breaker on a service panel or it may be a stand-alone switch.
