

# Photovoltaic bracket C-shaped steel core aluminum

## Overview

---

Which material should be used for photovoltaic (PV) support structures?

When it comes to selecting the material for photovoltaic (PV) support structures, it generally adopts Q235B steel and aluminum alloy extrusion profile AL6005-T5. Each material has its advantages and considerations, and the choice depends on various factors. Let's compare steel and aluminum for PV support structures:.

What is the best material for a PV bracket?

This characteristic makes aluminum a suitable choice for PV installations in coastal areas or locations with high humidity. At present, the main anti-corrosion method of the bracket is hot-dip galvanized steel with a thickness of 55-80  $\mu\text{m}$ , and aluminum alloy with anodic oxidation with a thickness of 5-10  $\mu\text{m}$ .

How do I choose a steel or aluminum PV support structure?

Ultimately, the selection of steel or aluminum for PV support structures depends on project-specific factors such as the size of the installation, load requirements, budget, site conditions (e.g., wind and snow loads, corrosive environments), and sustainability goals.

Why do you need a C-Rail for a photovoltaic roof?

This is because, in addition to its high quality and reliability, it also impresses with its versatility. And thus enables the safe, simple and fast installation of photovoltaic systems on the most diverse types of roofs. An important part of the system is the aluminium C-rail.
