

Photovoltaic energy storage system distribution map

Overview

Where is solar data available?

The data on the solar resource is available for a land surface between 60°N and 45°S parallels (up to 55°S in New Zealand), covering over 99% of the world's population. Regions in the far north and far south are excluded due to unavailability or insufficient quality of the data from geostationary meteorological satellites.

Where can I find solar resource data?

Explore solar resource data via our online geospatial tools and downloadable maps and data sets. Access our tools to explore solar geospatial data for the contiguous United States and several international regions and countries.

What are the energy storage options for photovoltaics?

This review paper sets out the range of energy storage options for photovoltaics including both electrical and thermal energy storage systems. The integration of PV and energy storage in smart buildings and outlines the role of energy storage for PV in the context of future energy storage options.

What is a theoretical solar PV potential?

The long-term energy content of the solar resource available at a certain location defines the theoretical solar PV potential (Chapter 2.3). For PV technology, the energy content is well quantified by the physical variable of global horizontal irradiation (GHI).

What raster data is used to calculate photovoltaic power potential (pvout)?

The primary input is a global raster data layer, representing the long-term average of photovoltaic power potential (PVOUT), calculated by the Solargis approach. We consider a typical large-scale PV power plant.

What are the input parameters of a solar system?

Besides the technical settings of the PV system and local geography, two input parameters are the most influential: solar resource and air temperature. The solar resource, or solar radiation, is quantified by a set of data layers calculated by the Solargis model, based on satellite images and atmospheric data.
