

Photovoltaic inverter master and slave control

Overview

Can a master-slave control system control parallel inverters connected to a PV system?

This study proposes a master-slave control system for controlling parallel inverters connected to a PV system. The master inverter is connected to Energy Storage Devices (ESDs) and is responsible for maintaining stable voltage on the load bus.

What is a master-slave PV inverter?

In order to maximize the profitability of big photovoltaic (PV) plants, high-power PV inverters of more than 500 kW are becoming attractive. The master-slave (MS) inverter is one of the most interesting architectures.

Are PV unit inverters slaves?

The PV unit inverters are considered slaves and share load powers based on the connected strings' maximum power. The proposed control strategy guarantees effective tracking of the panels' maximum power through the integration of Perturb and Observe (P&O) with PID-based MPPT, as well as the minimization of circulating currents between inverters.

What is the difference between a master and a slave inverter?

The master inverter is connected to Energy Storage Devices (ESDs) and is responsible for maintaining stable voltage on the load bus. The PV units are connected via slave inverters and are managed using a dual-loop Proportional Integrator Derivative (PID) control approach, with the outer loop maximizing solar panel output.

How to optimize a master-slave inverter?

Apart from the efforts of making the devices more efficient, their proper choice and configuration may further improve the performance of the PV-system. This paper presents the idea for optimization of a master-slave

inverter by setting the Pon and Poff parameters. The method is illustrated by results from the PV-system in Melle, in Belgium.

What is a master-slave control system?

The proposed system is intended to decrease the initial cost of the system. A master-slave control system is employed to distribute power among parallel systems. The storage inverter serves as the master inverter and is responsible for maintaining the system output voltage within an acceptable range.
